BE58 NAV Mode Usage

Introduction

Following testing it has been discovered that use of the autopilot NAV mode to track a VOR radial or GPS track during a JoinFS shared cockpit session can result in the non-flying pilot's aircraft appearing to enter a steep bank and sideslip.

Effective immediately, use of NAV mode is prohibited on BAV BE58 aircraft to prevent this issue arising. Basic autopilot modes (e.g. ALT, V/S, HDG etc) may still be used where appropriate at the discretion of instructors/examiners.

The autopilot NAV switch will be placarded inop as soon as feasible.
